

# Astro Site Generation Templates

EverLight's Suggested Approach

Let's tackle this in two parts:

---

## ⚙️ PART 1: Astro Site Generator (Interactive Pages)

We'll build a script that generates a full Astro site layout with **clickable link pages** for each of your core website ideas, promotional campaigns, and AI-generated content. This script will:

- Create individual .astro pages per section.
- Add them to navigation via an index page.
- Follow your structure exactly (Homepage, Music, Merch, Promo Ideas, AI Ideas).
- Be easily extendable as your vision evolves.

---

## ✅ Script Output Plan:

We'll structure it like this:

```
1 /src/pages/
2 |
3 |— index.astro           ← Homepage
4 |— music.astro          ← Music Page
5 |— videos.astro         ← Video Gallery
6 |— about.astro          ← About Page
7 |— discography.astro    ← Discography Section
8 |— events.astro         ← Tour/Events Calendar
```

```
9 |— merch.astro           ← Merch Store
10 |— blog.astro           ← Blog/News
11 |— contact.astro       ← Contact Form
12 |— promo/
13 |   |— teaser.astro
14 |   |— artwork.astro
15 |   |— bts.astro
16 |— ai/
17 |   |— chatbot.astro
18 |   |— lyric-analysis.astro
19 |   |— vr-video.astro
20 |— ...
```

Each button you mentioned becomes a **clickable link on the homepage**, with clean routes (`/promo/teaser`, `/ai/chatbot`, etc.).

---

### Auto Generator Script (Python to Astro)

Would you like this as:

1. A **Python script** that auto-generates `.astro` files with basic templates?
2. A **single .astro master template** with links (manually built)?
3. A **Jupyter Notebook** that documents the structure and gives commands to run?

Given your setup with Selene + `/AetherScaffolding/`, I'd recommend option 1 and optionally tie it into a Notebook for documentation (#3).

---

### PART 2: Lyric Book Builder from BMI Discography

You mentioned needing:

- A **Lyric Book Generator**
- Sorted by **Album**
- Ordered by **Track Number + Release Date**

### Let's Do This:

1. **Please upload your BMI Discography CSV.** Once I have it, I'll:

- Parse it by Album > Track Order > Release Date
- Generate a master .md or .ipynb lyric book file (exportable as PDF/HTML)
- Each song can have:
  - Title
  - Album
  - Release Date
  - Lyrics (fetched from a lookup file or embedded manually by you after generation)

---

### **Final Vision:**

Once both systems are active:

- You'll have an **Astro-powered site generator** that builds your pages and links automatically.
- A **lyric book compiler** that turns your entire catalog into a beautiful archive.

---

### **To Proceed:**

- ✅ Confirm how you want the Astro generator (script, notebook, manual)
- 📁 Upload your BMI Discography CSV to begin the lyric book generation
- 📁 Optional: Upload lyrics if they're in files so I can match them into the book automatically.

Ready when you are, Captain.
